# What are proxies

A forward proxy, often called a proxy, proxy server, or web proxy, is a server that sits in front of a group of client machines. When those computers make requests to sites and services on the Internet, the proxy server intercepts those requests and then communicates with web servers on behalf of those clients, like a middleman.

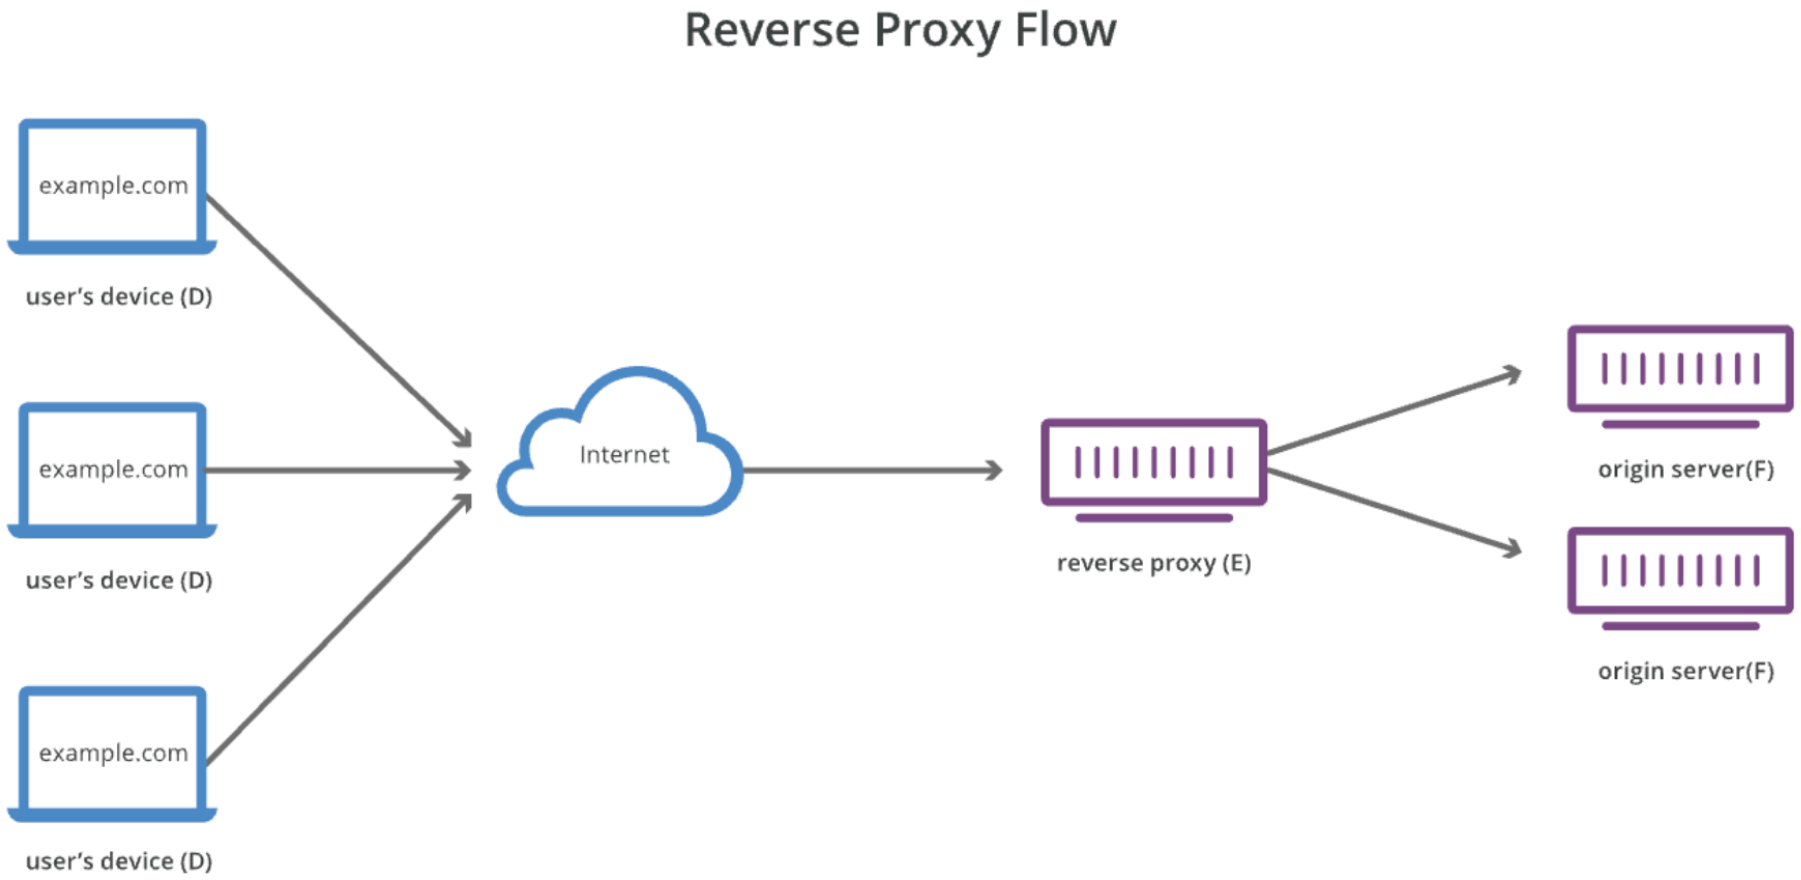

# What are proxies

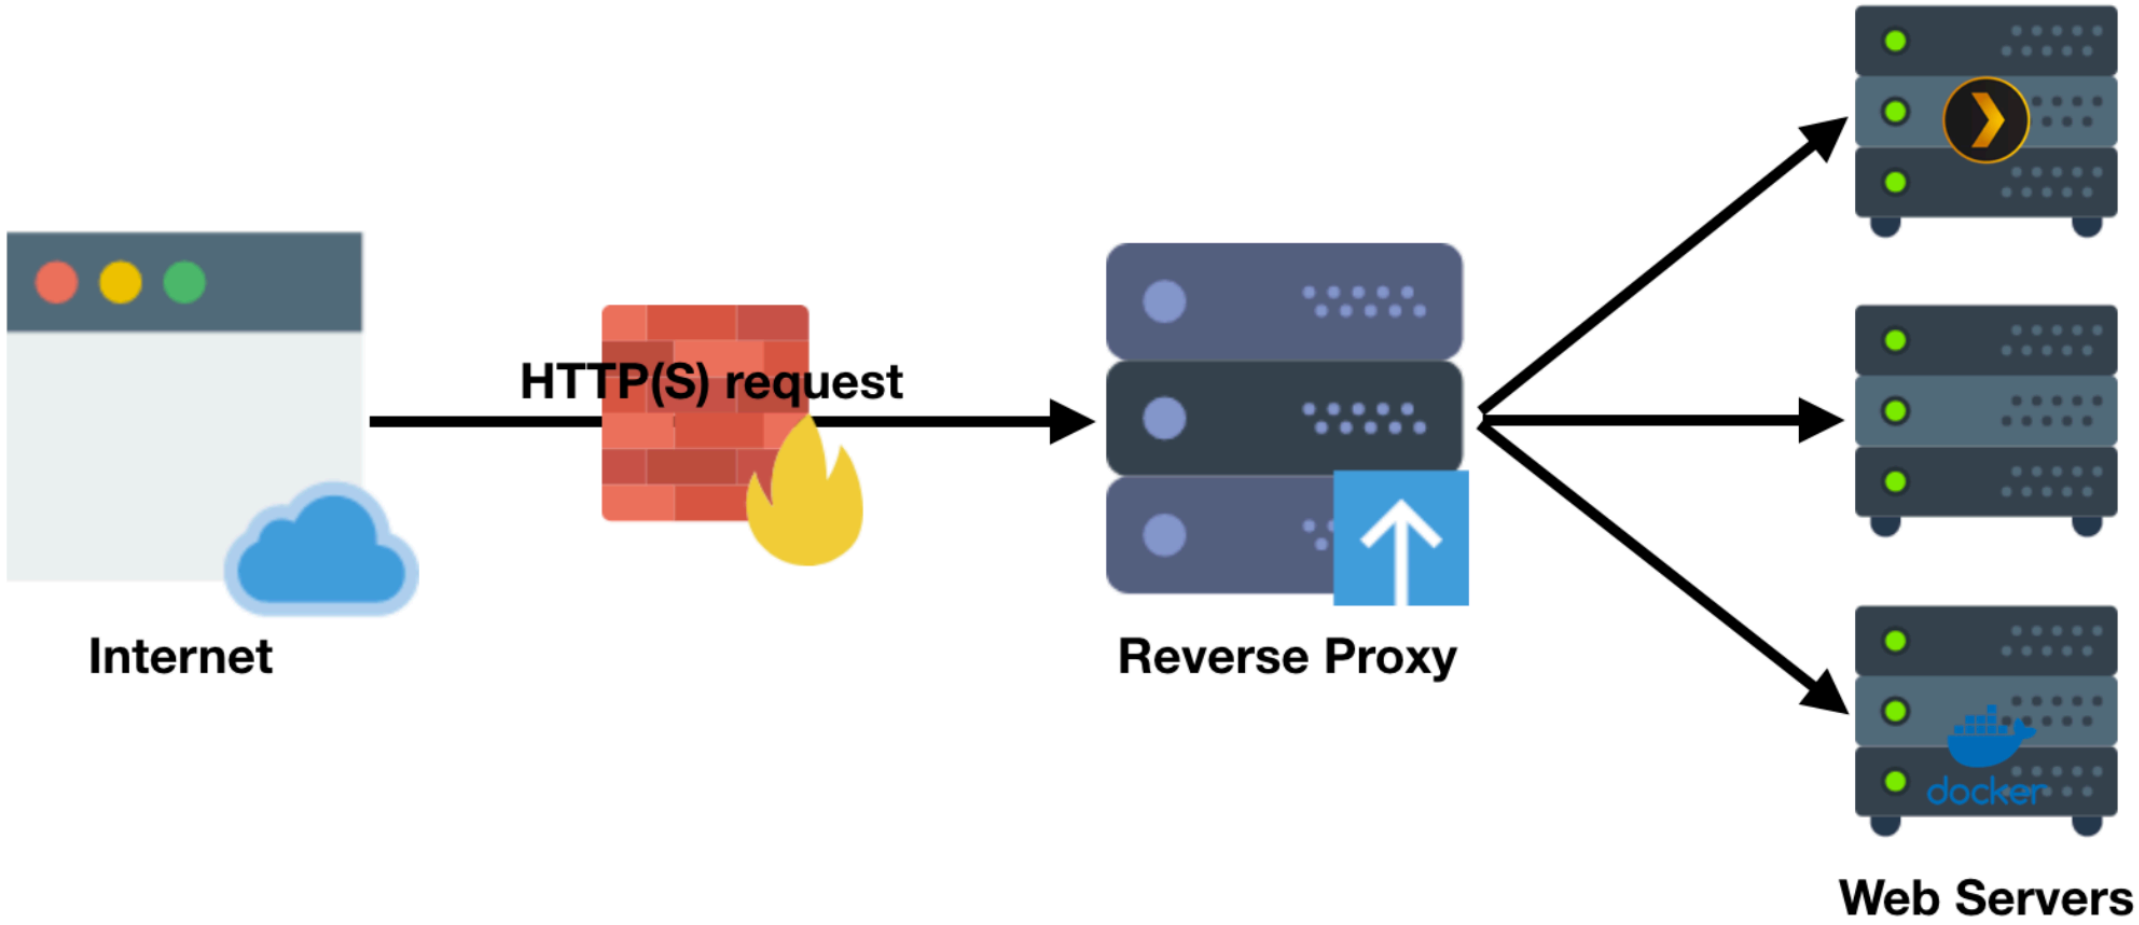

# What is a reverse proxy

A reverse proxy is a server that sits in front of one or more web servers, intercepting requests from clients. This is different from a forward proxy, where the proxy sits in front of the clients. With a reverse proxy, when clients send requests to the origin server of a website, those requests are intercepted at the network edge by the reverse proxy server. The reverse proxy server will then send requests to and receive responses from the origin server.

# What is a reverse proxy

# Reverse Proxy

# NGINX

- HTTP/HTTPS web server
- Can be used as load balancer, reverse proxy, HTTP cache.
- Supports mail protocols link SMTP and POP3.
